1. WHY IS ORGANIC MINERALS THE BEST WAY FOR TISSUE ABSORPTION AND CELLULAR VITALIZATION?

It is called "Electrical/Magnetic Attraction. Equals repel and opposites attract. Inorganic minerals DO NOT have the necessary electrical/magnetic attraction for the villi in the intestinal wall and the absorption of minerals into the bloodstream and cells. The intestinal wall is "cationic (positive charged). The food you eat is positive charged. The food must be changed to a "anionic" (negative charged) which is the opposite of a positive charge. This creates a mutual attraction for each other and the food is digested and absorbed as nature intended it to be. The bile in the gall bladder manufactured by the liver is secreted into the intestines with each meal. Bile helps change the polarity of food for proper absorption.

2. WHAT CAUSES AN INORGANIC MINERAL TO BECOME AN ORGANIC MINERAL?

The number one source of chemical change from inorganic to organic is the friendly bacteria in the soil. Ninety percent of all soil based bacteria are human, animal and plant friendly. It is these microorganisms found abundantly in natural soils without chemicals and insecticides to destroy them, that feed on a polysaccharide sugar created and secreted into the soil by the root system of the plants, grasses and trees that are growing above ground. The friendly flora are attracted to and feed on this abundant sugar and then excretes a waste material loaded with "fulvic acid".

3. WHAT DOES THIS FULVIC ACID DO TO MAKE MINERALS ORGANIC?

This very special material changes the mineral into an ionized form and reduces the size of all the minerals in the soil down to an acceptable and absorbable particle size small enough to fit through the cell membranes of the root system of the plants above. Inorganic minerals can be in variable sizes and if too large will not fit through the roots systems of plants. Also, minerals are either cationic or anionic and they need to be changed into an electrical/magnetic ionized form for the proper attraction to the roots of the above plants for absorption to take place adequately.

4. WHAT DOESIONIZED MINERALS HAVE THAT OTHER MINERALS DO NOT?

Proper sizing and the necessary positive/negative charging from the" fulvic acids" ability to convert the magnetic charging from one pole to an opposite pole so the electrical/magnetic field is compatible with the roots of all plants so immediate absorption is possible. Without the friendly bacteria in the soil and also in our intestines reduces significantly the ability to absorb nutrients, especially minerals. Organic Minerals are normally .0001 microns in diameter. Ten times smaller than any colloidal mineral and far superior in cellular utilization and energy activity.
5. WHAT IS THE VALUE OF COLLOIDAL MINERALS?

A colloidal mineral does only one thing. It prevents the mineral from settling out of the solution that it is in and falling to the bottom of the container. Colloidal Minerals do not guarantee particle sizing, they are not electrically or magnetically attracted to the intestinal wall or the cells in general and their particle size is usually too large for entrance into the cell wall. Most colloidal minerals are .001 to .009 microns in diameter and are too large for most cells to handle or absorb. They, therefore, pass out of the body as an unusable substance. If the particle size is too large, the minerals can get "hung up" inside the cell and cause 'ARYGRIA', a graying or bluing of the skin and internal organs. This cannot happen with an ORGANIC SILVER. Organic Silver is ten times smaller than any other form of silver and is one thousand per cent more effective in reaching and destroying pathogenic micro-organisms. It is the best!

6. WHAT IS THE BOTTOM LINE TO HEALTH AND CELLULAR WELL-BEING?

"ENERGY"! The Fulvic Acid from the friendly bacteria is the finest natural chelating material for ionizing minerals. It is as good as it is because of its energy. To convert a mineral from a positive charge to a negative charge by natural means requires a very special form of chemistry and it has been established by science that fulvic acid can chelate minerals into a superior absorbable form above and beyond any other amino acid chelate. It is the best and guarantees the highest output of energy for natural mineral activation and utilization within the cells and in between the cells throughout the body.

7. WHY DO YOU FEEL SO GOOD AND ENERGETIC RIGHT AFTER A THUNDER AND LIGHTING STORM?

Because the electrical/magnetic energy of the thunder, water and lightning charges the atmosphere with negative ions. These are the healthy ions and come from the natural removal of positive ions which are created by indoor heaters and air conditioning inside your house and car. Positive ions make you tired and weaken the cellular activities of all body systems. Negative ions work in the opposite manner and uplift your spirits and the whole body in general with a sense of well-being. Organic minerals do the same thing and magnetically encourage the blood flow of removing the bad from your body and allowing the good to enter and revitalize your cells for health, energy and wellness.

8. DOES ORGANIC SILVER ANGEL DESTROY AND REMOVE THE MAJORITY OF ALL SINGLE-CELLED, PATHOGENIC MICRO-ORGANISMS?

YES! Silver is a mineral with no nutritional value to the cells of the body. It serves no purpose other than a totally natural destroyer of single-celled pathogenic, disease causing micro-organisms. That is its purpose as provided by Mother Nature. Upon contact with a disease causing microbe, it immediately effects a respiratory enzyme in the breathing chemistry of the negative virus, bacteria or yeast cell and it suffocates and dies. It does not harm the body in any way. It does not destroy the friendly bacteria anywhere within the body or the intestines. It is completely body friendly unless it is manufactured in an inferior way such as NOT being organic in nature. The body does not handle inorganic minerals well. Drinking water contains inorganic minerals, especially calcium. Too much inorganic calcium in mineral
water will contribute to circulatory diseases, hardening of the arteries. All table salt is INORGANIC and will actually cause tissue dehydration by holding water outside the cell, especially if there is a magnesium/potassium deficiency inside the cell, and it also holds too much water inside the blood stream causing high blood pressure. Inorganic minerals harm the body. Small amounts here and there are OK, but too much should be avoided.
